### **Molecular Beam Epitaxy**

Molecular-beam epitaxy (MBE) is an epitaxy method for thin-film deposition of single crystals. The MBE process was noticed in the late 1970s at Bell Telephone Laboratories by J. R. Arthur and J. J. LePore. This phenomenon was subsequently observed and described in detail by Alfred Y. Cho.

### **Molecular-beam epitaxy - Wikipedia**

Molecular beam epitaxy (MBE) is an elegant material growth technique that is most simply described as a very refined form of vacuum evaporation or physical vapor deposition, with exquisite control over material purity, interface formation, alloy compositions, and doping concentrations. The major feature that enables these qualities is the extremely clean ultrahigh-vacuum (UHV) environment in the material growth system.

Monolayer tellurium (Te) or tellurene has been suggested by a recent theory as a new two-dimensional (2D) system with great electronic and optoelectronic promises. Here we present an experimental study of epitaxial Te deposited on highly oriented pyrolytic graphite (HOPG) by molecular-beam epitaxy. Scanning tunneling microscopy of ultrathin layers of Te reveals rectangular surface cells with the cell size consistent with the theoretically predicted  $\beta$ -tellurene, whereas for thicker films ...
