### **Numerical Solution Of Singularly Perturbed**

In this paper, we discuss the numerical solution of singularly perturbed differential-difference equations exhibiting dual layer behavior. First the second order singularly perturbed differential-difference equation is replaced by an asymptotically equivalent second order singularly perturbed ordinary differential equation.

Abstract This paper discusses the numerical solution of 1-D convection-diffusion-reaction problems that are singularly perturbed with two small parameters using a new mesh-adaptive upwind scheme that adapts to the boundary layers. The meshes are generated by the equidistribution of a special positive monitor function.

negative shift has been used for delay. The Bezier curves method can solve boundary value problems for singularly perturbed differential-difference equations.

### **Numerical Solution of Singularly Perturbed Delay ...**

A singularly perturbed differential-difference equation is an ordinary differential equation in which the highest derivative is multiplied by a small parameter and involving at least one delay or advance term. In recent papers the terms negative or left shift and positive or right shift have been used for delay and advance respectively.
