Diesel Engine Principle and Working Cycle Explained: Basically, there are two types of diesel engine types - the Four Stroke and Two Stroke. The 'Diesel Cycle' uses higher Compression-Ratio. It was named after German engineer Rudolph Diesel, who invented and developed first Four-Stroke diesel engine. The four strokes of the diesel cycle are similar to that of a petrol engine.

They learn principles of a diesel engine. In a laboratory they dismantle and reassemble equipment. They learn to test oil used in a viscometer. Engineer cadets familiarized with the operation, care and control of various types of diesel engines. The candidates learn electric engineering. They operate switchboards in an engine room.

The material for construction also depends on the speed on the engine and slow speed marine diesel engines have crankshafts fabricated out of plain carbon steel with a percentage of carbon lying between 0.2 & 0.4%, while the alloy steels are used for engines having a relatively higher speed.

Cylinder lubricating oil for a low-speed main propulsion diesel engine is admitted to each cylinder during the compression stroke. Cylinder lubricating oil, for lubricating the piston rings and the liner, has to be admitted when the piston, piston rings and the liner are in cool condition and the piston is moving upward so that oil can be retained on the piston rings and sprayed by the piston rings on the liner walls.

Publisher Summary. This chapter focuses on theoretical aspects and general principles of diesel engine. It explains the diesel engine that is designed to work on the two-stroke or on the four-stroke cycle. In the four-stroke cycle, both inlet (and suction) and exhaust valves are initially open.

For instance, a 6 cylinder diesel engine has a firing order 1 5 3 6 2 4 This is the order that each cylinder goes by, following the 4 strokes mentioned above. This sequence has been engineered to allow the diesel engine to run smoothly with no imbalance. Here is some diesel engine trivia on high performance diesel engines.

The common rail system of fuel injection was used in marine diesel engines during the early and mid-19th century. These systems were well known in a particular type of engine famously called the "Doxford" engines or opposed piston engines. These engines are hard to find these days as they have been replaced by more efficient engines.
