Some rotary wing aircraft are designed to stop the rotor for forward flight so that it then acts as a fixed wing. For vertical flight and hovering it spins to act as a rotary wing or rotor, and for forward flight at speed it stops to act as a fixed wing providing some or all of the lift required.

### Rotorcraft - Wikipedia

Rotary Wing Aerodynamics Helicopter are extremely versatile vehicles that have many unique capabilities unavailable to fixed wing aircraft. However, helicopters are inefficient in forward flight relative to a fixed wing aircraft.

To further commemorate R&WI's 50th anniversary this year, we are sharing again the work of perhaps our most popular writer, rotorcraft aerodynamicist Ray Prouty. His 30 years of R&WI columns shared the wealth of aerodynamic knowledge that nurtured generations of rotorcraft engineers. Each week online, we will reprint a selection from those columns.

### Ray Prouty: Progress in Helicopter Aerodynamics - Rotor ...

Tandem rotor helicopters have two large horizontal rotor assemblies mounted one in front of the other. Currently this configuration is mainly used for large cargo helicopters. Single rotor helicopters need a mechanism to neutralize the yawing movement produced by the single large rotor. This is commonly accomplished by a tail rotor, coaxial rotors, and the NOTAR systems.
