Spectrum analyzers display an "overload" message if overload occurs. The first response is often to raise the reference level, either directly or by manually increasing the attenuation of the step attenuator. An alternative is to use an external band pass filter to limit OTA signals to the band of interest.

Spectrum Analyzer

A basic task for spectrum analyzers is to measure the level and frequency of sin-ewave signals. The following examples illustrate an effective way of performing these measurements. A signal generator, e.g. R&S SMBV provides the signal source. Using the Spectrum Analyzer

Spectrum analyzers display RF signals from base stations and other emission sources. They find rouge signals, measure carriers and distortion, and verify base stations. Unlike a power meter, they validate carrier frequency and identify desired and undesired signals.

The patented DPX ® spectrum processing engine brings live analysis of transient events to spectrum analyzers. Performing up to 292,968 frequency transforms per second, transients of a minimum event duration of 3.7 μs in length are displayed in the frequency domain. This is orders of magnitude faster than swept

analysis techniques.
