Spring Annotations Spring framework implements and promotes the principle of control inversion (IOC) or dependency injection (DI) and is in fact an IOC container. Traditionally, Spring allows a developer to manage bean dependencies by using XML-based configuration. There is an alternative way to define beans and their dependencies.

Starting from Spring 2.5 it became possible to configure the dependency injection using annotations. So instead of using XML to describe a bean wiring, you can move the bean configuration into the component class itself by using annotations on the relevant class, method, or field declaration. Annotation injection is performed before XML injection.

We can use this annotation to make Spring initialize other beans before the annotated one. Usually, this behavior is automatic, based on the explicit dependencies between beans. We only need this annotation when the dependencies are implicit, for example, JDBC driver loading or static variable initialization.
